

1. Fixed point algorithma) For a fixed point iteration $|g'(x)| < 1$

So

$$g(x) = ax + b \Rightarrow g'(x) = a$$

$$|g'(x)| = |a| < 1$$

If this is true then $g(x)$ ^{at \bar{x}} has a Unique Solution,
 $g(\bar{x}) = \bar{x}$

$$g(\bar{x}) = a\bar{x} + b = \bar{x} \Rightarrow \bar{x} = \frac{b}{1-a}$$

Suppose $|x_k - \bar{x}| = |g(x_{k-1}) - g(\bar{x})|$, for a fixed
 point iteration

$$x_{k+1} = g(x), \quad g(\bar{x}) = \bar{x} = \frac{b}{1-a}$$

$$|x_k - \bar{x}| = |ax_{k-1} + b - \bar{x}|$$

$$\begin{aligned} |x_k - \bar{x}| &= \left| ax_{k-1} + b - \frac{b}{1-a} \right| = \left| ax_{k-1} - \frac{ab}{1-a} \right| \\ &= \left| a \left(x_{k-1} - \frac{b}{1-a} \right) \right| = |a| |x_{k-1} - \bar{x}| \end{aligned}$$

$$|x_k - \bar{x}| = |a| |x_{k-1} - \bar{x}|$$

Using triangular inequality.

$$|x_k - \bar{x}| \leq |a| |x_{k-1} - \bar{x}| = |a|^2 |x_{k-2} - \bar{x}|$$

$$|x_k - \bar{x}| \leq |a|^k |x_0 - \bar{x}|$$

As $k \rightarrow \infty$, since $|a| < 1$, then $|a|^k |x_0 - \bar{x}| \rightarrow 0$

therefore $|x_k - \bar{x}| \rightarrow 0$, hence the fixed point iteration converges to \bar{x} .

$$x_k = \bar{x} = \frac{b}{1-q}$$

b) Using the Intermediate value Theorem, it can be stated that

$$\frac{g(x_k) - g(\bar{x})}{x_k - \bar{x}} = g'(\xi)$$

$$g(x_k) - g(\bar{x}) = g'(\xi) (x_k - \bar{x})$$

for a fixed point Scheme

$$g(x_k) = x_{k+1}$$

$$g(\bar{x}) = \bar{x}$$

$$g'(\xi) = q$$

So

$$x_{k+1} - \bar{x} = q (x_k - \bar{x}) = q^2 (x_{k-2} - \bar{x})$$

~~or~~

$$x_{k+1} - \bar{x} = q^k (x_1 - \bar{x})$$

$$x_{k+1} - \bar{x} = q^{k+1} (x_0 - \bar{x})$$

$$\text{but } x_{k+1} - \bar{x} = e_{k+1}, \quad x_0 - \bar{x} = e_0$$

$$e_{k+1} = q^{k+1} e_0$$

hence satisfied,

c)

$$l_{k+1} \approx \frac{q}{q-1} (x_{k+1} - x_k)$$

$$l_{k+1} = x_{k+1} - \bar{x}$$

Subtracting and adding x_k on the left hand side, we obtain

$$l_{k+1} = x_{k+1} - \bar{x} - x_k + x_k$$

$$l_{k+1} = x_{k+1} - x_k + x_k - \bar{x}$$

we have

$$l_{k+1} = q l_k \Rightarrow l_k = \frac{q}{l_{k+1}} \text{ and } l_k = x_k - \bar{x}$$

therefore

$$\cancel{l_{k+1} = x_{k+1} + x_k - \bar{x}} \text{ becomes}$$

$$\cancel{l_{k+1} \approx x_{k+1} - x_k}$$

$$l_{k+1} = x_{k+1} - \bar{x}_k + x_k - \bar{x} \text{ becomes,}$$

$$l_{k+1} \approx x_{k+1} - x_k + l_k$$

$$l_{k+1} \approx x_{k+1} - x_k + \frac{q}{l_{k+1}}$$

$$l_{k+1} \approx \frac{q}{q-1} (x_{k+1} - x_k)$$

d)

$$l_{k+1} \approx \frac{q}{q-1} (x_{k+1} - x_k)$$

we know that $g(x_k) = x_{k+1} = qx_k + b$

$$l_{k+1} \approx \frac{q}{q-1} (g(x_k) - x_k) = \frac{q}{q-1} (qx_k + b - x_k)$$

$$l_{k+1} \approx qx_k + q\left(\frac{b}{q-1}\right), \text{ but } \bar{x} = \frac{b}{1-q}$$

$$e_{k+1} = q x_k - q \bar{x} = q(x_k - \bar{x})$$

$$\text{take } x_k - \bar{x} = e_k$$

$$e_{k+1} = q e_k = q^2 e_{k-1}$$

$$e_{k+1} = q^3 e_{k-2}$$

$$e_{k+1} = q^k e_{k-k}$$

$$e_{k+1} = q^{k+1} e_0$$

hence exactly equal to the true error.

8). from $q(x) = \frac{1}{10}x + 1$, $\Rightarrow q = \frac{1}{10}$, $b = 1$

$$\text{tolerance, } \epsilon = 10^{-8}$$

$$\text{Using } |e_{k+1}| \leq \epsilon, \text{ but } e_{k+1} = q^{k+1} e_0$$

$$|q^{k+1} e_0| \leq \epsilon$$

$$\text{Using logarithms, } \log|q^{k+1}| + \log|e_0| \leq \log \epsilon$$

$$(k+1) \log|q| + \log|e_0| \leq \log \epsilon$$

$$(k+1) \log|q| \leq \log \epsilon - \log|e_0|$$

$$k \log|q| \leq \log \epsilon - \log|e_0| - \log|q|$$

$$\text{but } q = \frac{1}{10} = 10^{-1}$$

$$-k \log 10 \leq \log \epsilon - (\log|e_0| + \log 10^{-1})$$

$$k \geq \frac{8 \log 10 + \log|e_0| - \log 10}{\log 10} = 8 + \log|e_0| - 1$$

$$k \geq 7 + \log|e_0|$$

Hence it requires atleast 7 iterations, and this depends on $\log|e_0|$

2. Steffensen's Method.

$$x_{k+1} = x_k - \frac{(g(x_k) - x_k)^2}{g(g(x_k)) - 2g(x_k) + x_k}$$

a) Show ~~that~~ analytically that for any $g(x)$, the iteration used in Steffensen's Method satisfies

$$\lim_{x \rightarrow \bar{x}} \left(x - \frac{(g(x) - x)^2}{g(g(x)) - 2g(x) + x} \right) = \bar{x}$$

Where \bar{x} satisfies $g(\bar{x}) = \bar{x}$

Using L'Hopital's Rule.

$$\lim_{x \rightarrow \bar{x}} \left(x - \frac{2(g'(x) - 1)(g(x) - \bar{x})}{g'(x)g'(g(x)) - 2g'(x) + 1} \right)$$

$$\text{but } g(\bar{x}) = \bar{x}$$

$$= \bar{x} - \frac{2(g'(\bar{x}) - 1)(\bar{x} - \bar{x})}{g'(\bar{x})g'(g(\bar{x})) - 2g'(\bar{x}) + 1}$$

$$= \bar{x} - 0$$

$$= \bar{x}$$

b) Show analytically that Steffensen's iteration converges in one step for the fixed point problem.

$$g(x) = ax + b = x, \text{ for } |a| < 1$$

$$\text{from } x_{k+1} = x_k - \frac{(g(x_k) - x_k)^2}{g(g(x_k)) - 2g(x_k) + x_k}$$

at $k=0$

$$x_1 = x_0 - \frac{(g(x_0) - x_0)^2}{g(g(x_0)) - 2g(x_0) + x_0}$$

$x_1 \neq$ $g(x_0) = ax_0 + b$

$$x_1 = x_0 - \frac{(ax_0 + b - x_0)^2}{a(ax_0 + b) + b - 2(ax_0 + b) + x_0}$$

$$x_1 = x_0 - \frac{(a-1)(x_0) + b}{(a-1)}$$

$$x_1 = x_0 - x_0 + \frac{b}{a-1} = x_0 - x_0 - \frac{b}{a-1}$$

$$x_1 = \frac{b}{1-a} = \bar{x}$$

$$\underline{\underline{x_1 = \bar{x}}}$$

hence it converges in one step.

No. 3 LU Decomposition

$$E_4 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{41} & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$A = \begin{bmatrix} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{bmatrix}$$

9) Show that

$$E_4 E_3 E_2 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{41} & 1 & 0 & 0 \\ -L_{31} & 0 & 1 & 0 \\ -L_{41} & 0 & 0 & 1 \end{bmatrix}$$

$$E_4 E_3 E_2 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -L_{41} & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ -L_{31} & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{21} & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -L_{41} & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{21} & 1 & 0 & 0 \\ -L_{31} & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$E_4 E_3 E_2 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{41} & 1 & 0 & 0 \\ -L_{31} & 0 & 1 & 0 \\ -L_{41} & 0 & 0 & 1 \end{bmatrix}$$

- b) Choose multipliers L_{ij} so that applying E_4, E_3, E_1 to A zeros out the entries below a_{11} .

$$E_4 E_3 E_1 A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -L_{21} & 1 & 0 & 0 \\ -L_{31} & 0 & 1 & 0 \\ -L_{41} & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{bmatrix}$$

Choose $L_{21} = -1$
 $L_{31} = 2$
 $L_{41} = -3$

$$E_4 E_3 E_1 A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 \\ -2 & 0 & 1 & 0 \\ 3 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{bmatrix}$$

$$= \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 10 & 4 & -9 \\ 0 & -16 & -11 & 18 \end{bmatrix}$$

- c) Show that the inverse of $E_4 E_3 E_1$ is

$$(E_4 E_3 E_1)^{-1} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_{21} & 1 & 0 & 0 \\ L_{31} & 0 & 1 & 0 \\ L_{41} & 0 & 0 & 1 \end{bmatrix}$$

$$(E_1 E_3 E_2)^{-1} = \frac{1}{\det(E_1 E_3 E_2)} (\text{Adjoint}(E_1 E_3 E_2))$$

$$\det(E_1 E_3 E_2) = \begin{vmatrix} 1 & 0 & 0 & 0 \\ -L_2 & 1 & 0 & 0 \\ -L_3 & 0 & 1 & 0 \\ -L_4 & 0 & 0 & 1 \end{vmatrix} = -1 \begin{vmatrix} 1 & 0 & 0 \\ -L_2 & 1 & 0 \\ -L_3 & 0 & 1 \end{vmatrix} = \underline{\underline{1}}$$

the Adjoint $(E_1 E_3 E_2)$ is the transpose of the Cofactor Matrix $(E_1 E_3 E_2)$

$$\text{Cofactor Matrix} = \begin{bmatrix} 1 & L_2 & L_3 & L_4 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\text{Adjoint}(E_1 E_3 E_2) = \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_2 & 1 & 0 & 0 \\ L_3 & 0 & 1 & 0 \\ L_4 & 0 & 0 & 1 \end{bmatrix}$$

$$|E_1 E_3 E_2| = \frac{1}{1} \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_2 & 1 & 0 & 0 \\ L_3 & 0 & 1 & 0 \\ L_4 & 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_2 & 1 & 0 & 0 \\ L_3 & 0 & 1 & 0 \\ L_4 & 0 & 0 & 1 \end{bmatrix}$$

3d) for U

$$E_{41} E_{31} E_{41} A = U_1$$

$$(E_{42} E_{32}) U_1 = U_2$$

$$E_{43} U_2 = U$$

therefore

$$U = \underline{E_{43} E_{42} E_{32} E_{41} E_{31} E_{21} A}$$

Hence U is obtained by computing the product
 $U = E_{43} U_2 = E_{43} E_{42} E_{32} U_1$ and $U_1 = E_{41} E_{31} E_{21} A$

for L

$$(E_{41} E_{31} E_{21})^{-1} = L_1$$

$$(E_{42} E_{32})^{-1} L_1 = L_2$$

$$(E_{43})^{-1} L_2 = L$$

So

$$L = (E_{43} E_{42} E_{32} E_{41} E_{31} E_{21})^{-1}$$

To compute this inverse, we can assume

$$(AB)^{-1} = A^{-1} B^{-1}$$

therefore

$$L = (E_{43} E_{42} E_{32} E_{41} E_{31} E_{21})^{-1} = (E_{43} E_{42} E_{32})^{-1} (E_{41} E_{31} E_{21})^{-1}$$

$$\text{but } (E_{41} E_{31} E_{21})^{-1} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_{21} & 1 & 0 & 0 \\ L_{31} & 0 & 1 & 0 \\ L_{41} & 0 & 0 & 1 \end{bmatrix}$$

$$(E_{13} E_{42} E_{32})^{-1} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & L_{32} & 1 & 0 \\ 0 & L_{32}L_{42} + L_{43} & L_{43} & 1 \end{bmatrix}$$

$$L = (E_{13} E_{42} E_{32})^{-1} (E_{41} E_{31} E_{21})^{-1}$$

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & L_{32} & 1 & 0 \\ 0 & L_{32}L_{42} + L_{43} & L_{43} & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ L_{21} & 1 & 0 & 0 \\ L_{31} & 0 & 1 & 0 \\ L_{41} & 0 & 0 & 1 \end{bmatrix}$$

Let $L_{21} = a$ $L_{32} = d$
 $L_{31} = b$ $L_{42} = e$
 $L_{41} = c$ $L_{43} = f$

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ a & 1 & 0 & 0 \\ da + b & d & 1 & 0 \\ fb + a(df + e) + c & df + e & f & 1 \end{bmatrix}$$

And $U = E_{43} E_{42} E_{32} E_{41} E_{31} E_{21} A$

48) Find the LU decomposition of the matrix in (3)

$$A = \begin{bmatrix} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{bmatrix}$$

$$A = LU$$

where

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ l_{21} & 1 & 0 & 0 \\ l_{31} & l_{32} & 1 & 0 \\ l_{41} & l_{42} & l_{43} & 1 \end{bmatrix}, \quad U = \begin{bmatrix} u_{11} & u_{12} & u_{13} & u_{14} \\ 0 & u_{22} & u_{23} & u_{24} \\ 0 & 0 & u_{33} & u_{34} \\ 0 & 0 & 0 & u_{44} \end{bmatrix}$$

Using Gaussian Elimination method on ~~a~~ A , we obtain an ~~upper~~ triangular Matrix U , as follows.

take $l_{21} = -1$

$$\begin{array}{l} R_1 \\ R_2 \\ R_3 \\ R_4 \end{array} \left[\begin{array}{cccc} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{array} \right] \xrightarrow{R_2 \leftarrow R_2 + R_1} \left[\begin{array}{cccc} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 5 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{array} \right]$$

take $l_{31} = -2$ ~~In this case $l_{21} = -1$~~

$$\left[\begin{array}{cccc} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 5 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{array} \right] \xrightarrow{R_3 \leftarrow R_3 + 2R_2} \left[\begin{array}{cccc} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 5 \\ 0 & -18 & -4 & -1 \\ -9 & 5 & -5 & 12 \end{array} \right]$$

~~In this case $l_{31} = -2$~~

$$\begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & -18 & -4 & -1 \\ -9 & 5 & -5 & 12 \end{bmatrix} \xrightarrow{R_4 \leftarrow R_4 + 3R_1} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & -18 & -4 & -1 \\ 0 & -16 & -11 & 18 \end{bmatrix}$$

In this case ^{we took} $L_{41} = -3$

for L_{32} take $L_{32} = 9$

$$\begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & -18 & -4 & -1 \\ 0 & -16 & -11 & 18 \end{bmatrix} \xrightarrow{R_3 \leftarrow R_3 - 9R_2} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & -16 & -11 & 18 \end{bmatrix}$$

take $L_{42} = 8$

$$\begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & -16 & -11 & 18 \end{bmatrix} \xrightarrow{R_4 \leftarrow R_4 - 8R_2} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & -3 & 2 \end{bmatrix}$$

take $L_{43} = -\frac{3}{5}$

$$\begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & -3 & 2 \end{bmatrix} \xrightarrow{R_4 \leftarrow R_4 + \frac{3}{5}R_3} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & 0 & -\frac{47}{5} \end{bmatrix}$$

Hence we Obtain, U ,

$$U = \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & 0 & -\frac{47}{5} \end{bmatrix}$$

Correspondingly L ,

$$L = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 1 & 0 & 0 \\ -2 & 9 & 1 & 0 \\ -3 & 8 & -\frac{3}{5} & 1 \end{bmatrix}$$

So $A = LU$

$$A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 1 & 0 & 0 \\ -2 & 9 & 1 & 0 \\ -3 & 8 & -\frac{3}{5} & 1 \end{bmatrix} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & 0 & -\frac{47}{5} \end{bmatrix}$$

So

$$LU = A$$

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 1 & 0 & 0 \\ -2 & 9 & 1 & 0 \\ -3 & 8 & -\frac{3}{5} & 1 \end{bmatrix} \begin{bmatrix} 3 & -7 & -2 & 2 \\ 0 & -2 & -1 & 2 \\ 0 & 0 & 5 & -19 \\ 0 & 0 & 0 & -\frac{49}{5} \end{bmatrix} = \begin{bmatrix} 3 & -7 & -2 & 2 \\ -3 & 5 & 1 & 0 \\ 6 & -4 & 0 & -5 \\ -9 & 5 & -5 & 12 \end{bmatrix}$$

hence

$$\underline{\underline{LU = A}}$$

5. Jacobi Method

Assume that the following 2×2 matrix A is strictly diagonally dominant

$$A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

q) Show that $\rho(I - \Delta^{-1}A) < 1$

take $\Delta = \begin{bmatrix} a_{11} & 0 \\ 0 & a_{22} \end{bmatrix}$

$$\Delta^{-1} = \begin{bmatrix} 1/a_{11} & 0 \\ 0 & 1/a_{22} \end{bmatrix}$$

$$\Delta^{-1}A = \begin{bmatrix} 1/a_{11} & 0 \\ 0 & 1/a_{22} \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} 1 & a_{12}/a_{11} \\ a_{21}/a_{22} & 1 \end{bmatrix}$$

then

$$I - \Delta^{-1}A = \begin{pmatrix} 0 & a_{12}/a_{11} \\ a_{21}/a_{22} & 0 \end{pmatrix}$$

the Spectral radius, ρ , is the maximum ^{absolute} value of the eigen values; so to compute the eigen values we use the characteristic equation.

$$|(I - \Delta^{-1}A) - \lambda I| = 0$$

$$\begin{vmatrix} -\lambda & a_{12}/a_{11} \\ a_{21}/a_{22} & -\lambda \end{vmatrix} = 0 \Rightarrow \lambda^2 = \frac{a_{12}a_{21}}{a_{11}a_{22}}$$

Since a_{22} and a_{11} are diagonally dominant
~~and~~ entries then $a_{22}a_{11} > a_{21}a_{12}$, therefore

$$\lambda^2 = \frac{a_{21}a_{12}}{a_{22}a_{11}} < 1$$

$$\lambda = \pm \sqrt{\frac{a_{21}a_{12}}{a_{22}a_{11}}}$$

ρ is the largest $|\lambda|$, so

$$|\lambda| = \left| \sqrt{\frac{a_{21}a_{12}}{a_{22}a_{11}}} \right| < 1$$

So the Spectral radius $\rho(I - D^{-1}A) < 1$

Jacobi Iteration will Converge, since for Jacobi,
 we take $M = D$, and we have shown that

$$\rho(I - M^{-1}A) < 1, \text{ hence the iteration converges}$$

Since according to ~~convergence~~ an iteration converges
 if and only if $\rho(I - M^{-1}A) < 1$

$$X_{k+1} = (I - M^{-1}A)X_k + M^{-1}b.$$

a) Show that if $M=A$, the iteration converges in one step.

If $M=A$

$$X_{k+1} = (I - A^{-1}A)X_k + A^{-1}b$$

but $A^{-1}A = I$

$$X_{k+1} = (I - I)X_k + A^{-1}b$$

$$X_{k+1} = A^{-1}b$$

but $A\bar{x} = b \Rightarrow \bar{x} = A^{-1}b$

therefore $X_{k+1} = \bar{x}$, hence converges in one step

b) Show that $Ae_k = -r_k$, where $r_k = b - AX_k$,

$$e_k = x_k - \bar{x},$$

and \bar{x} solves $AX = b$ exactly

$$Ae_k = A(x_k - \bar{x}).$$

$$Ae_k = AX_k - A\bar{x}$$

we know that $A\bar{x} = b$

$$Ae_k = AX_k - b$$

$$\underline{\underline{Ae_k = -r_k}} \quad \text{since } r_k = b - AX_k.$$

c) Show that the iteration for the error e_k is given by

$$e_{k+1} = (I - M^{-1}A) e_k$$

from

$$X_{k+1} = (I - M^{-1}A) X_k + M^{-1}b$$

Subtract \bar{x} from both sides

$$X_{k+1} - \bar{x} = (I - M^{-1}A) X_k - \bar{x} + M^{-1}b$$

We know that $X_{k+1} - \bar{x} = e_{k+1}$

$$e_{k+1} = (I - M^{-1}A) X_k - \bar{x} + M^{-1}b$$

$$\text{Take } A\bar{x} = b.$$

$$e_{k+1} = (I - M^{-1}A) X_k - \bar{x} + M^{-1}A\bar{x}$$

$$e_{k+1} = (I - M^{-1}A) X_k - (I - M^{-1}A)\bar{x}$$

$$e_{k+1} = (I - M^{-1}A) (X_k - \bar{x})$$

$$\text{but } X_k - \bar{x} = e_k$$

$$e_{k+1} = (I - M^{-1}A) e_k$$

d) Show that

$$\|e_k\| \leq \|I - M^{-1}A\|^k \|e_0\|$$

from $e_{k+1} = (I - M^{-1}A) e_k$

$$e_{k+1} = (I - M^{-1}A) (I - M^{-1}A) e_{k-1}$$

$$e_{k+1} = (I - M^{-1}A)^2 e_{k-1}$$

$$e_k = (I - M^{-1}A)^2 e_{k-2}$$

$$e_k = (I - M^{-1}A)^3 e_{k-3}$$

$$\vdots$$

$$e_k = (I - M^{-1}A)^k e_0$$

take the Modulus both sides, and then apply the triangular inequality

$$\|e_k\| = \|(I - M^{-1}A)^k e_0\|$$

$$\|e_k\| \leq \|(I - M^{-1}A)\|^k \|e_0\|$$

Q Show that

$$k \geq \frac{\log(\epsilon)}{\log \|I - M^{-1}A\|}$$

from $\|e_k\| \leq \epsilon$

~~but $\|e_k\| \leq \|(I - M^{-1}A)\|^k \|e_0\|$~~

but $e_k = (I - M^{-1}A)^k e_0$

$$\|(I - M^{-1}A)^k e_0\| \leq \epsilon$$

taking log both sides we obtain

$$k \log \|I - M^{-1}A\| + \log \|e_0\| \leq \log \epsilon$$

$$k \log \|I - M^{-1}A\| \leq \log \epsilon - \log \|e_0\|$$

Since $\log \|I - M^{-1}A\| < 0$, then

$$k \geq \frac{\log \epsilon - \log \|e_0\|}{\log \|I - M^{-1}A\|}$$

$$k \geq \frac{\log(\epsilon / \|e_0\|)}{\log \|I - M^{-1}A\|}$$

*) Since $\rho(I - M^{-1}A)$ is the largest absolute value of the eigen values of $(I - M^{-1}A)$, and the number of iterations is given by

$$k \geq \frac{\log(\epsilon / \|e_0\|)}{\log \|I - M^{-1}A\|}$$

$$k \geq \frac{\log \epsilon}{\log \|I - M^{-1}A\|} - \frac{\log \|e_0\|}{\log \|I - M^{-1}A\|}$$

So for larger values of $\rho(I - M^{-1}A)$ implies the term $\log \|e_0\|$

is also large. This is

$$\frac{\log \|e_0\|}{\log \|I - M^{-1}A\|}$$

because $\log \|I - M^{-1}A\|$ ^{will be} ~~is~~ ^{very} small to reduce $\log \|e_0\|$.

But again, as $\log \|I - M^{-1}A\|$ approaches to zero from the left side, it means that this term $\log \|e_0\|$

$\frac{\log \|e_0\|}{\log \|I - M^{-1}A\|}$ increases and ~~are~~ eventually become

Undefined at $\log \|I - M^{-1}A\| = 0$, this case the solution ~~no longer~~ exists, so the the estimate iterations k will seem to underestimate the actual number of k i.e.

$$k \geq \frac{\log(\epsilon)}{\log \|I - M^{-1}A\|}$$

+ a very big term after which becomes undefined.

a) Suppose

$$X_{k+1} - X_k = \alpha_k P_k \quad \text{--- (1)}$$

The residual $r_{k+1} = r_k - \alpha_k A P_k$, where A is a positive symmetric definite matrix.

Using equation (1) and since α_k is a constant

$$r_{k+1} = r_k - A \alpha_k P_k = r_k - A (X_{k+1} - X_k)$$

$$r_{k+1} = r_k - A X_{k+1} - \cancel{A X_k}$$

$$r_{k+1} = r_k - A X_k - A X_{k+1}$$

but the residual $r_k = b - A X_k$, given $A X_k = b$

so $r_{k+1} = b - A X_{k+1}$

b) The directions P_k satisfy $P_{k+1}^T A P_k = 0$, iff P_{k+1} is A -conjugate to P_k with A a positive symmetric definite Matrix.

- This means that P_{k+1} is mutually orthogonal to P_k , given that P_{k+1} and P_k are eigen vectors of A with corresponding eigen values λ_{k+1} and λ_k

- If this is true then

$$A P_k = \lambda_k P_k \quad \text{for } k=1, \dots, n$$

Since $A \in \mathbb{R}^{n \times n}$ and is symmetric positive definite then \exists n eigen vectors P_1, P_2, \dots, P_n which are mutually orthogonal

i.e. $(p_i, p_j) = 0$ if $i \neq j$

therefore

$$\begin{aligned} p_{k+1}^T A p_k &= (p_{k+1}, A p_k) \\ &= (p_{k+1}, \lambda p_k) \\ &= \lambda (p_{k+1}, p_k) \end{aligned}$$

Since k is a positive integer, so $k+1 \neq k$,

$$p_{k+1}^T A p_k = \lambda (0) = 0$$

Hence the directions p_k satisfy $p_{k+1}^T A p_k = 0$

Since they are mutually orthogonal, hence A -Conjugate to each other.
